## MY ELLANSÉ JOURNEY

by Dr Sophie Converset

I started using ELLANSÉ over four years ago, and it remains my preferred dermal filler. After injecting for 15 years, I was looking for an alternative to Hyaluronic Acid because I noticed that patients who had used HA repeatedly over the years had very full cheeks and a firm, artificial appearance. However, ELLANSÉ perfectly complements my vision of what aesthetic treatment should offer – natural-looking, long-lasting results and happy patients.

**“Even after two or three years, the results look incredibly natural”**

### Unique Composition

ELLANSÉ is becoming increasingly important in my work. Its unique composition, which is PolyCaprolactone (PCL)-based, provides great elasticity, has a good safety profile and plays an important role in building up collagen scaffold. This is why the effects look more natural and last longer.

ELLANSÉ offers better integration and more natural-looking results. I often see patients who have only been injected with ELLANSÉ once and, even after two or three years, the results look incredibly natural, with patients still looking much better than they did before they were first injected.

### Outstanding Results

I started using ELLANSÉ for volumisation and contouring, and noticed that we used less product (than volumising HA filler), results

lasted longer and my patients' appearance was more natural.

In my practice, ELLANSÉ in fact improves my patients' skin. As a plastic surgeon, I believe it is essential that the skin is at its best and healthiest before any lifting procedure. For patients who eventually move on to such a procedure, in my experience, ELLANSÉ works very well to improve the overall skin quality.

### Extensive Duration

I see immediate results in my patients treated with ELLANSÉ M and these continue to improve; after six months they look better than they did at three months, and after one year they look better still. These results are then maintained for a period of two years, which is very impressive.

Two of my patients, Sabine\* and Patricia\*, both wanted a natural-looking, fresher appearance without changing their overall features. The final results were exactly what they had hoped for. Together, we were pleased with how well the product lasted and the result was still natural-looking.

### Superior Product

ELLANSÉ delivers outstanding results. Patients are often familiar with and more comfortable using HA fillers but, as Healthcare Professionals, we are aware of the advancements in the industry and I hope that patients will start recommending these advanced products to each other soon as well. ELLANSÉ is a preferred treatment option for me, and my patients are very happy with the exceptional results.

\* Full details of Sabine and Patricia's treatment results can be found on pages 28-31 and 32-35 respectively.

Details of Dr Converset's treatment can be found on pages 32-35.

## RESTORING YOUTH AND ENHANCING FORM

by Dr Francisco de Melo

Today, we understand more about the ageing process than ever before, and the latest scientific evidence offers us unique insight and new ways in which to manage this natural transition.

Plastic surgeons, dermatologists and cosmetic physicians around the world are using techniques to slow down or reverse some of the effects of time. In doing so, we focus on structural elements, mainly on volume.

### **The Importance of Volume**

As we age, we lose volume due to atrophy of bone and fat. This, in turn, leaves the face looking older and the bone structure becomes more prominent and skeletal. Skin starts to sag, and the folds around the nose and mouth become deeper. However, once we replace the loss of volume, these effects are partially or almost wholly corrected, depending on other individual factors.

### **A New Class of Filler**

The majority of fillers on the market are Hyaluronic Acid-based, which means they only replace volume without providing effective long-term results. ELLANSÉ belongs to a new class of fillers that offer immediate results due to their volumising capacity, as well as longer-term benefits owing to the formation of new collagen through a process called neocollagenesis.

This newly-formed collagen provides volume for a long period of time. In my experience,

it also improves the soft tissue and skin quality and elasticity, without feeling fake or like a foreign element to the body.

Furthermore, due to its PolyCaprolactone (PCL), ELLANSÉ has adjustable longevity, thereby offering clinical results that can span from one and a half to well over four years\*.

**“In my view, ELLANSÉ helps long-term volume retention and improves skin quality and elasticity”**

### **Better Balance**

The other characteristic of ELLANSÉ is that it also allows us to change the proportion and shape of certain facial features. We can create a more balanced face that presents a more desirable ratio between the face's features and its overall structure, avoiding more invasive procedures like the surgical placement of cheek or chin implants.

### **Safety and Satisfaction**

Personally, and on behalf of my patients, the filler's safety profile is the most crucial element: ELLANSÉ has an excellent safety record, with minimal adverse effects reported to date. ELLANSÉ is my filler of choice because it allows me to offer safe treatments, obtain consistently excellent and long-lasting results, and provide exceptional patient satisfaction.

\* Expected longevity in-vivo based on extrapolation of clinical data from ELLANSÉ S and ELLANSÉ M accepted PCL degradation behaviour.

## RESTORING VOLUME AND CONTOURS THROUGH COLLAGEN STIMULATION

by Dr Luca Piovano

Over the past few years, the fields of medicine and cosmetic surgery have continued to move closer towards each other. So much so, that this is impacting our clinical treatments: as surgeons, where possible, we are now able to offer less invasive procedures with equally successful results.

### Innovative Fillers

We are able to offer procedures that are less invasive because the latest dermal fillers available to us offer amazing results. These days, we are increasingly using fillers based on PolyCaproLactone (PCL) which have outstanding safety records, provide a high viscosity and elasticity and, furthermore, boast impressive longevity due to their ability to enable the production of fresh collagen.

“ELLANSÉ boasts impressive longevity”

These bio-stimulating dermal fillers use the body's natural response to foreign bodies and stimulate the formation of collagen around the microspheres, resulting in a longer-lasting implant. Ultimately, this treatment offers a versatile, non-surgical approach to increase soft tissue and contouring, and presents a variety of potential cosmetic uses.

### Extensive Benefits

The aim is not only to provide a smoother skin surface but also to restore the face's

individual features, providing a balance of the filler's lifting effect on the face's curved and hollowed areas. The use of PCL dermal fillers is also far more widespread in treatments designed to restore and rejuvenate the face. Most commonly, it is used by plastic surgeons to complement an existing surgical procedure.

### An Effective Formula

ELLANSÉ is made up of an aqueous carboxymethylcellulose, with synthetic PolyCaproLactone microspheres. It is used at a fixed concentration – with different polymer chain lengths providing variable levels of longevity and durability.

The PCL microspheres are smooth and round, and are therefore the perfect shape for use in dermal fillers. The treatment is carried out in an outpatient environment, using ELLANSÉ in a variety of ways depending on the specific imperfection we are looking to correct, including different injection techniques such as linear threading, fanning technique, and cross-hatching with local anaesthetic and ELLANSÉ dermal filler.

### Effortless Results

This type of filler procedure is simple and has a good safety profile. It does not have a disruptive effect on the patient's everyday life, including their social or professional activities, and the results are highly satisfying, even with a single application. Furthermore, the treatment can be repeated if required.

## INNOVATIVE FACIAL REGENERATION

by Dr Shang-Li Lin

I see much innovation in the field of aesthetic medicine and make sure to stay informed of the latest developments in order to maintain the highest possible standard of practice and be able to offer my patients the very best treatment and experience. Five years ago, when researching injectables, I came across ELLANSÉ, a PolyCaproLactone (PCL)-based collagen stimulator that provides immediate correction of facial ageing and imperfections. I knew instantly that this was the cutting-edge product I had been looking for.

### One Solution

Using a collagen stimulator which offers a high degree of refinement allows us to address various signs of facial ageing, such as brow ptosis, the appearance of jowls, and loss of facial definition to name a few. Using only ELLANSÉ, I can offer results that are much more effective and precise than those achieved through other injectables.

ELLANSÉ can be used to provide support for the layers of soft tissue above the injection sites (similar to the way in which surgical implants work), as well as correct and restore volume loss, thereby improving facial contours and giving a plump appearance to the skin, leaving it feeling soft and natural to the touch.

For physicians, this is a product with a good safety profile that enables versatility in aesthetic treatment, offers great potential, and demonstrates the advantages that a good filler should have. For patients, regardless of age, gender or ethnic

background, ELLANSÉ can be used as part of a tailored treatment plan to achieve various objectives whilst providing a cost-effective, non-surgical option for long-term maintenance of a youthful appearance. I believe the combination of these various successes is why ELLANSÉ has become so popular, in the Asian market and elsewhere, so soon after its launch.

### Immediate and Long-lasting

By injecting ELLANSÉ into multiple tissue layers, signs of ageing can be corrected immediately, whilst the collagen that is restored creates long-lasting and natural-looking volume. In my observation, patients injected with ELLANSÉ S enjoy visible improvement even up to the end of the second year after treatment. As a result, many of my patients come back every year or two just for a touch-up to improve their appearance or to treat previously untreated problem areas in the face, rather than having to address the original problem all over again.

**“ELLANSÉ creates  
long-lasting and  
natural-looking volume”**

Now, when patients ask me what treatments I can offer that last longer, reduce wrinkles, lift sagging, and restore facial definition (and, crucially, leave no sign that the patient has undergone any treatment), I insist that ELLANSÉ is the only choice.

### 3D MAPPING – HOW RESULTS WERE ACHIEVED

by Dr Shang-Li Lin

Before

After

In the upper face, the images show a more enhanced eyebrow shape and a better contour of the glabella, along with vertical and horizontal lifting of the eyebrows and eyelids which is the result of volumisation in the ROOF. In the midface, a downward sliding of the soft tissue seen as ptosis of deep fat compartments and jowls has been corrected, coupled with a rejuvenated anterior projection after volume restoration in the premaxillary spaces and the deep fat compartments.

In the lower face, the images show improvement in the definition of the jawline, and a reduced descent in submental fat. Chin projection and proportion also demonstrated significant improvement along with the improvement of melomental folds. The space between the eyebrows and the shape of the nasal dorsum have also narrowed following the restoration of the anterior projections in these areas.

 ELLANSÉ®

by Sinclair Pharma

ELLANSÉ is a unique and innovative range of long-lasting rejuvenating fillers which introduces a new era of cutting-edge solutions for facial beauty treatments.

The ELLANSÉ range brings multiple benefits, instantly reducing wrinkles and folds as well as stimulating the generation of the body's own natural collagen for beautiful, natural-looking and long-lasting results.

Collagen is one of the skin's most important natural support structures and helps maintain the skin's tension, elasticity and suppleness. Over time, our skin gradually loses its natural collagen, leading to laxity of the skin and the formation of wrinkles and folds.

ELLANSÉ uses the body's natural response to stimulate the generation of collagen, restoring a fresh and youthful appearance.

"ELLANSÉ is a treatment with a good safety profile, and with consistently excellent and long-lasting results as well as exceptional patient satisfaction"

Dr Francisco de Melo
